

# **MPQ2019-AEC1**

40V, 300mA, Low-Quiescent Current Adjustable Output Linear Regulator AEC-Q100 Qualified

## DESCRIPTION

The MPQ2019 is a low-power linear regulator that supplies power to systems with highvoltage batteries. It includes a wide 3V to 40V input range, low-dropout voltage and lowquiescent supply current. The low-quiescent and low-dropout current voltage allow operations at extremely low-power levels. Therefore, the MPQ2019 is ideal for low-power microcontrollers battery-powered and equipment.

The MPQ2019 provides a wide variety of fixed output-voltage options (if requested): 1.8V, 1.9V, 2.3V, 2.5V, 3.0V, 3.3V, 3.45V, and 5.0V; Also it provides the output-adjustable option (from 1.2V to 15V).

The regulator output current is limited internally, and the device is protected against short-circuit, over-load, and over-temperature conditions.

The MPQ2019 includes thermal shutdown (TSD), current-limiting fault protection, and is available in a SOIC-8 EP package.

### **FEATURES**

- 3V to 40V Input Range
- 10µA Quiescent Supply Current
- Stable with Low-value Output Ceramic Capacitor (> 0.47µF)
- 300mA Specified Current
- Fixed 5V, 3.3V, and Adjustable Output (1.2 V to 15 V) Versions
- Output ±2% Accuracy Over Temperature
- Specified Current Limit
- Power Good
- Programmable Power Good Delay
- Thermal Shutdown and Short-Circuit
   Protection
- -40°C to +150°C Specified Junction Temperature Range
- Available in a SOIC-8 EP Packages
- Available in AEC-Q100 Grade 1

### **APPLICATIONS**

- Industrial/Automotive Applications
- Portable/Battery-Powered Equipment
- Ultra Low-Power Microcontrollers
- Cellular Handsets
- Medical Imaging

All MPS parts are lead-free, halogen free, and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

| HBM (Human Body   | Mode)4kV |
|-------------------|----------|
| MM (Machine Mode) | )200V    |

### Recommended Operating Conditions <sup>(4)</sup>

Output Voltage V<sub>OUT</sub> ..... 1.2V to 15V Operating Temperature ..... T<sub>A</sub>=-40°C to +125°C T<sub>A</sub>≤T<sub>J</sub>≤ +150°C

#### Thermal Resistance (5) θ.ΙΑ $\theta_{\rm JC}$ SOIC-8 EP......50 ......10 ....°C/W

#### Notes:

- 1) Exceeding these ratings may damage the device.
- 2) The maximum allowable power dissipation is a function of the maximum junction temperature T<sub>J</sub> (MAX), the junction-to-ambient thermal resistance  $\theta_{JA}$ , and the ambient temperature T<sub>A</sub>. The maximum allowable continuous power dissipation at any ambient temperature is calculated by  $P_D$  (MAX) = (T<sub>J</sub> (MAX)- $T_A$ )/ $\theta_{JA}$ . Exceeding the maximum allowable power dissipation produces an excessive die temperature, causing the regulator to go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- Devices are ESD sensitive. Handle with precaution. 3)
- 4) The device is not guaranteed to function outside of its operating conditions.
- 5) Measured on JESD51-7, 4-layer PCB.

## **ELECTRICAL CHARACTERISTICS**

 $V_{IN} = V_{EN} = 13.5V$ ,  $T_A = -40^{\circ}$ C to  $+125^{\circ}$ C,  $T_A \le T_J \le +150^{\circ}$ C, unless otherwise noted. Typical values are at  $T_A = +25^{\circ}$ C.

Notes:

Dropout Voltage: Measured when the output voltage V<sub>OUT</sub> has dropped 100mV from the nominal value obtained at V<sub>IN</sub>=13.5V.

7) Derived from bench characterization. Not tested in production.

## **PIN FUNCTIONS**

| Pin # | Name | Description  |
|-------|------|--|
| 1     | OUT  | Regulated Output Voltage. Only a low-value ceramic capacitor ( $\geq 0.47\mu$ F) on the output is required for stability.          |
| 2     | NC   | No Connection.   |
| 3     | GND  | Ground. Connect the exposed pad and GND to the same ground plane.  |
| 4     | IN   | Input Voltage. Connect a 3V to 40V supply to IN.   |
| 5     | EN   | Regulator On/Off Control Input. Logic low shuts down the IC; logic high starts up the IC. Connect EN to IN for automatic start-up. |
| 6     | PG   | Power Good.  |
| 7     | PGDL | Programmable Power-Good Delay Time.  |
| 8     | FB   | Feedback Input for Output Adjustable Version. FB is regulated to 1.25V nominally. This terminal is used to set the output voltage. |

## **TYPICAL PERFORMANCE CHARACTERISTICS**

 $C_{IN} = 1\mu F$ ,  $C_{OUT} = 22\mu F$ ,  $V_{OUT} = 5V$ ,  $T_A = 25^{\circ}C$ , unless otherwise noted.

## TYPICAL PERFORMANCE CHARACTERISTICS (continued)

 $C_{IN} = 1\mu F$ ,  $C_{OUT} = 22\mu F$ ,  $V_{OUT} = 5V$ ,  $T_A = 25^{\circ}C$ , unless otherwise noted.

## **TYPICAL PERFORMANCE CHARACTERISTICS** (continued)

 $C_{IN} = 1\mu F$ ,  $C_{OUT} = 22\mu F$ ,  $V_{OUT} = 5V$ ,  $T_A = 25^{\circ}C$ , unless otherwise noted.

**Shutdown through V<sub>IN</sub>** V<sub>IN</sub> = 12V, I<sub>OUT</sub> = 300mA

#### Short-Circuit Steady State VIN = 12V

## FUNCTIONAL BLOCK DIAGRAM

## **OPERATION**

The MPQ2019 is a linear regulator that supplies power to systems with high-voltage batteries. It includes a wide 3V to 40V input range, lowdropout voltage, and a low-quiescent supply current (see Figure 1).

The MPQ2019 provides a wide variety of fixed output-voltage options: 1.8V, 1.9V, 2.3V, 2.5V, 3.0V, 3.3V, 3.45V, and 5.0V; Also, it provides the output-adjustable option (from 1.2V to 15V).

The output-adjustable version has an output that is adjustable from 1.2V to 15V with a simple resistor divider. It uses external feedback, allowing the user to set the output voltage with an external resistor divider. The FB threshold is 1.25V, typically.

The IC enters shutdown mode when EN is low. In shutdown mode, the pass transistor, control circuitry, reference, and all biases turn off; this reduces the supply current to <0.1 $\mu$ A. Connect EN to IN for automatic start-up.

The regulator output current is limited internally, and the device is protected against short-circuit, over-load, and over-temperature conditions (see Figure 2).

The peak-output current is limited to around 1000mA, which exceeds the 300mA recommended continuous-output current.

When the junction temperature is too high, the thermal sensor sends a signal to the control logic that shuts down the IC. The IC will re-start when the temperature has sufficiently cooled.

The maximum power-output current is a function of the package's maximum power dissipation for a given temperature.

The maximum power dissipation is dependent on the thermal resistance of the case and the circuit board, the temperature difference between the die junction and the ambient air, and the rate of air flow. GND and the exposed pad must be connected to the ground plane for proper dissipation.

### **COMPONENT SELECTION**

#### Setting the Output Voltage

Set the output voltage of the MPQ2019 by using a resistor divider (see Figure 3).

#### Figure 3. FB Resistor Divider to Set VOUT

Choose R2=1M $\Omega$  to maintain a 1.215 $\mu$ A minimum load. Calculate the value for R1 using the following equation:

$$R1 = R2 \times \left(\frac{V_{OUT}}{1.25V} - 1\right)$$

For a fixed-output version, VOUT can also be adjusted by adding an external resistor divider. When choosing an external divider, just note to take the internal FB resistor divider into consideration.

### Figure 4. FB Divider for Fixed-Output Version

When R2 is selected, R1 can be calculated by below equation:

$$R1 = \frac{R1_IN}{\frac{1.25 \times R1_IN \times (R2 + R2_IN)}{(V_{OUT} - 1.25) \times R2 \times R2_IN} - 1}$$

The internal FB resistor dividers for different fixed- output versions are shown in below Table.

 Table 1. Internal FB Resistor Divider

| Fixed-Output Voltage | R1_IN  | R2_IN |  |
|----------------------|--------|-------|--|
| 3.3V                 | 1.64MΩ | 1MΩ   |  |

Table 2 is an example of external FB divider to get various output voltages on fixed 3.3V output version.

| Table 2. 3.3V Fixed Output Version External |
|---|
| FB Divider                                  |

| V <sub>OUT</sub> (V) | R1 (kΩ) | R2 (kΩ) |
|----------------------|---------|---------|
| 11                   | 80.6    | 10      |
| 8.5                  | 59      | 10      |
| 8                    | 54.9    | 10      |
| 6.5                  | 43      | 10      |
| 5                    | 30.1    | 10      |

#### **Enable Control (EA)**

EN is a digital control pin that turns the regulator on and off. When EN is pulled below 0.3V, the chip shuts down. When EN is pulled above 1.8V, the chip starts up. If this function is not used, EN can be connected to  $V_{in}$  directly.

#### **Input Capacitor**

For efficient operation, place a ceramic capacitor (C1) between  $1\mu$ F and  $10\mu$ F of dielectric type (X5R or X7R) between the input pin and ground. Larger values in this range improve line transient response.

#### **Output Capacitor**

For stable operation, use a ceramic capacitor (C2) of type X5R or X7R between  $1\mu$ F and  $22\mu$ F. Larger values in this range improve load transient response and reduce noise. Output capacitors of other dielectric types may be used, but they are not recommended as their capacitance can deviate greatly from their rated value over temperature.

To improve load transient response, add a small ceramic (X5R, X7R, or Y5V dielectric) 2.2nF feed-forward capacitor in parallel with R1. The feed-forward capacitor is not required for stable operation.

#### **Output Noise**

The MPQ2019 exhibits noise on the output during normal operation. This noise is negligible for most applications. However, in applications that include analog-to-digital converters (ADCs) of more than 12 bits, consider the ADC's power supply rejection specifications. The feed-forward capacitor C2 across R1 reduces significantly the output noise.

#### PRELIMINARY SPECIFICATIONS SUBJECT TO CHANGE

### **PCB Layout Guidlines**

Efficient PCB layout is critical to achieve good regulation, ripple rejection, transient response, and thermal performance. It is recommended highly to duplicate the EVB layout for optimum performance.

If changes are necessary, refer to Figure 5 and follow the guidelines below:

- 1) Place input and output bypass ceramic capacitors close to IN and OUT, respectively.
- 2) Ensure all feedback connections are short and direct. Place the feedback resistors and compensation components as close to the chip as possible.
- Connect IN, OUT, and especially, GND, respectively, to a large copper area to cool the chip. This improves thermal performance and long-term reliability.
